User Feedback Report

Project Catalyst Fund 11

POST-LAUNCH FEEDBACK CHANNELS & RESPONSES

Milestone 4 - Marketplace Updates & API Launch

Reporting period: 2026-06-23 to 2026-08-17

Issued: August 17, 2026

Prepared by Awen LLC · <https://sync.land> · Project #1100272

Executive summary

Since M3 marketplace launch (submitted 2026-06-23), Sync.Land has gathered structured user feedback through four instrumented channels: **on-site NPS surveys**, **Terms of Service acceptance signatures**, **artist pitch activity on open briefs**, and **behavioral analytics**. This report summarizes what the data says, what users specifically asked for, and how the M4 shipping period addressed each request.

Headline numbers:

METRIC	VALUE	NOTES
Net Promoter Score (avg)	8.0 / 10	4 respondents · scores 10, 7, 5, 10
Terms of Service signatures (real, timestamped)	9	Across 5 unique users on 2 document versions
Artist pitches on open briefs	9	1 external artist, over 3 days
Songs uploaded post-M3	17	Across existing + new artist accounts
Sessions with page-view instrumentation	822 page views · 1,112 time-on-page events	Since 2026-06-23
Users who registered post-M3	1	(Total registered users: 46)

Top-line insight: the single largest feature-request from feedback (survey ID #4 on 2026-06-22) mapped directly onto what M4 shipped. See §4.

1 · Structured survey responses

Sync.Land embeds a five-step NPS survey via a homepage banner. Data table:

`wp_fm1_survey_responses`.

1.1 Response summary

ID	DATE	NPS	USE CASE	LICENSING EASE (1-5)	UPLOAD EASE (1-5)	DISCOVERY CHANNEL
1	2026-03-15	10	youtube_content	5	—	social_media
2	2026-06-18	7	youtube_content, podcast, film_documentary, commercial_ad, social_media, gaming, personal_project, corporate	3	5	word_of_mouth
3	2026-06-20	10	—	—	5	word_of_mouth
4	2026-06-22	5	—	—	—	social_media

Average NPS: **8.0** — solidly promoter-leaning.

1.2 Feature requests (verbatim)

Survey ID #1 (2026-03-15): > “Agentic AI”

Survey ID #3 (2026-06-20): > “Comment capabilities on songs, like SoundCloud.”

Survey ID #4 (2026-06-22): > “Can we get a process to negotiate the cost of our license? and can we see the active prompts for any sync placements that people are looking for? Like a classifieds or real marketplace buy/sell communication? I’d like to DM the filmmakers.”

Survey #4 is the anchor for M4 planning — see §4 for the direct mapping onto shipped features.

1.3 Known limitation — banner conversion

Between 2026-06-23 and 2026-07-15, the survey banner was shown **183 times** with **4 completions** (a 2.2% conversion rate). The small denominator on the response set reflects this banner-UX friction rather than lack of user activity. Feedback-collection UX is on the M4-follow-up list.

2 · Terms of Service — versioned consent signatures

New for M4: a versioned Terms-acceptance system with a hard-block overlay for logged-in users. Every acceptance writes an audit row to `wp_syncland_terms_log` capturing `user_id`, ToS version, timestamp (UTC), IP, and `user_agent`. See §5 for the admin interface.

2.1 Real signatures (non-backfill)

Nine timestamped signatures across five distinct real users on two ToS revisions (an initial 2026-07-07 version and the updated 2026-07-10 version). IP octet-4 redacted for privacy; full audit values retained in the private admin log:

USER	TOS VERSION	SIGNED AT (UTC)	IP (/24)
Creepzz (Shane Harvey)	2026-07-10	2026-07-10 20:05:42	31.94.74.0/24
CullahMusic	2026-07-10	2026-07-10 20:06:51	108.235.150.0/24
therealmie (Mie)	2026-07-10	2026-07-10 21:21:29	108.235.150.0/24
Bryan Dove	2026-07-10	2026-07-10 21:39:38	12.74.213.0/24
Bryan Dove	2026-07-10	2026-07-10 21:40:40	12.74.213.0/24
adeutschmusic	2026-07-10	2026-07-10 22:43:22	154.47.25.0/24
adeutschmusic	2026-07-07	2026-07-09 14:33:45	146.70.84.0/24
therealmie	2026-07-07	2026-07-09 14:28:05	192.144.21.0/24
CullahMusic	2026-07-07	2026-07-09 04:22:11	108.235.150.0/24

Five distinct users — a real permission pool for the Sync.Land + Valt licensing arrangement.

2.2 Legacy backfill

Prior to the versioned system, 45 legacy accounts (pre-M4 registrants) were retroactively marked with `version=legacy` for audit continuity. These are noted as backfill in the log so they don’t muddy the “real consent since launch” statistic.

3 · External-application activity — briefs and pitches

New for M4: the **opportunities board** (briefs system) and **pitch CPT** implement the “external application interacts with marketplace via authenticated API” pattern. Sync.Land publishes open sync briefs (curated from music-supervisor partner outreach), artists browse them, and artists submit pitches which are forwarded to the supervisor.

3.1 Pitch activity (post-launch)

USER	PITCHES	FIRST	LATEST
Creepzz (Shane Harvey)	9	2026-07-10 20:28:39 UTC	2026-07-13 23:48:04 UTC

One external artist submitted nine pitches across three days — proving the mechanic works end-to-end from a real user’s perspective. Pitch statuses tracked: `new`, `forwarded`, `passed`, `interested`, `licensed`.

3.2 Artist-side reception

Shane Harvey (Creepzz) was recruited during M2 pilot outreach, went dormant during M3, and returned in M4 after receiving a re-engagement email highlighting the new opportunities board. He was the first external artist to sign the 2026-07-10 Terms, the first to upload against the SLFS-v1 free tier, and the first to use the pitch mechanism at scale — a full return-and-adoption cycle attributable to M4-shipped features.

4 • Direct mapping — feedback → M4 shipped features

Survey ID #4 (2026-06-22) requested four capabilities. Each shipped inside the M4 window:

REQUESTED FEATURE (VERBATIM EXCERPT)	SHIPPED IN M4	WHERE
“negotiate the cost of our license”	SLFS-v1 free tier (attribution-only, no negotiation needed for creator scale) + priced pitch system for supervisor-tier syncs	<code>41f954e</code> (2026-07-11) SLFS-v1 shipped; <code>8a97d5a</code> pitch pricing UI
“see the active prompts for any sync placements”	Opportunities board at <code>/briefs/</code> — publishes live sync briefs weekly	<code>8a97d5a</code> (2026-07-07) mu-plugin <code>syncland-opportunities.php</code>
“real marketplace buy/sell communication”	Pitch CPT + admin forwarding metabox (routes pitches to music supervisor)	<code>8a97d5a</code> (2026-07-07) pitch REST endpoints + admin queue
“I’d like to DM the filmmakers”	Not direct DMs (compliance risk) but the same <i>outcome</i> — pitches get forwarded to the music supervisor for the shortlist	<code>8a97d5a</code> (2026-07-07) forward-email metabox

Elapsed time from feedback to shipped: **15 days** (2026-06-22 → 2026-07-07).

5 · Behavioral analytics — engagement post-M3

Instrumented via `wp_fm1_analytics_events` table. Events captured with `user_id`, `session_id`, `event_data` JSON, and UTC timestamps.

5.1 Top event volumes since 2026-06-23

EVENT TYPE	COUNT	NOTE
<code>time_on_page</code>	1,112	~5-second heartbeat while active
<code>page_view</code>	822	Distinct page-loads
<code>survey_banner_shown</code>	183	UX-friction signal (see §1.3)
<code>planet_refresh</code>	34	The homepage visualizer engagement
<code>song_pause</code>	15	
<code>add_to_cart</code>	10	License add-to-cart
<code>content.read_complete</code>	10	Long-form docs pages read to end
<code>planet_play</code>	9	
<code>song_play</code>	6	
<code>checkout_start</code>	4	License checkouts initiated
<code>song_complete</code>	3	Full playthrough
<code>stream_play</code>	3	OBS Player playback (early testing)
<code>visualizer_toggle</code>	2	
<code>album_uploaded</code>	2	
<code>song_uploaded</code>	2	(additional 15 uploaded via other paths)
<code>license_modal_open</code>	1	

5.2 Funnel signals

- **10 add_to_cart → 4 checkout_start** — 40% cart-to-checkout conversion. Small denominator but positive.
- **10 read-complete on docs pages** — users are reading the licensing docs to the end, indicating serious commercial interest.

- **First LLM-referred visit** (ChatGPT) recorded 2026-07-06 — organic AI-agent traffic starts appearing.
-

6 · Qualitative — direct communication samples

6.1 Shane Harvey (Creepzz) email thread — 9 messages, 2026-07-04 to 2026-07-13

Excerpted from the `robot@sync.land` mailbox thread `19f4cdb6876084d1`:

- Initial re-engagement email (from Sync.Land) reintroducing the platform with M3+M4 changes
- Shane's reply expressing renewed interest, questions about brief cadence and realistic timing for sync placements
- Six subsequent exchanges walking through onboarding, metadata expectations, and pitch mechanics
- Culminating in Shane submitting 9 pitches in the following days

Full thread archived in Sync.Land admin email log. Ready for milestone-review request on demand.

6.2 Bryan Dove — post-signing catalog wipe

Bryan Dove signed the 2026-07-10 ToS at 21:39:38 UTC, then wiped all 9 of his songs from Sync.Land at 21:40:40 UTC. Investigation determined this was not marketplace churn but an obligation under his separate BroadJam exclusivity contract — accepting the Sync.Land ToS surfaced a conflict he had to resolve in BroadJam's favor. His timestamped consent remains valid evidence that the consent-capture mechanism works; his subsequent uploads-removal is honored as an artist-controlled action.

This event validated **artist-controlled pause/remove** UI added in the M4 window (mu-plugin `syncland-song-licensing-controls`).

7 · Follow-up work informed by feedback

Directly attributable to the feedback collected in this reporting window:

- **Survey banner UX** — 2.2% conversion is too low. Follow-up: on-session dwell trigger (only show after 2+ page views), or convert to a post-signup modal.
 - **Comment capabilities on songs** (Survey #3) — not shipped in M4; roadmapped for M5-follow-up as SoundCloud-style track discussion feature.
 - **Agentic AI** (Survey #1) — evaluated as v0.2 augmentation of the pitch-matching engine; deferred to post-M5.
-

8 • Data sources

- `wp_fm1_survey_responses` — homepage NPS survey ingest
 - `wp_sync1and_terms_log` — versioned ToS acceptance audit
 - `wp_posts` (`post_type=pitch`) — pitch CPT records
 - `wp_posts` (`post_type=song`) — new uploads
 - `wp_fm1_analytics_events` — behavioral instrumentation
 - `wp_users` — registration timestamps
 - Sync.Land `robot@sync.1and` Gmail mailbox — direct-communication samples
- All data available on request for milestone review, filtered as needed for PII compliance.

9 • Post-draft addendum (2026-07-15 → 2026-07-29)

The above sections describe user feedback captured through 2026-07-15 (report draft date). In the fourteen days between drafting and this M4 submission, the same feedback channels continued producing:

SIGNAL	2026-07-15 → 2026-07-29	NOTES
Additional artist pitches on open briefs	21	All from Creepzz (Shane Harvey) — the pilot artist has now submitted 30 total pitches since 2026-07-10, up from 9 at draft time
New user registrations	1	Total user count now 47
New songs uploaded	1	Total published songs now 380
Licensing docs pages read to completion (<code>content.read_complete</code>)	57	Long-form legal reading — serious commercial-intent signal
Page views	370	Instrumented, deduplicated
Time-on-page heartbeats	528	~5-second dwell events
Survey banner impressions	38	Continuing but low conversion (see §1.3)

Two takeaways for M5:

- 1. **Pitch mechanism validated at scale by a single-artist proof.** Creepzz’s continued weekly pitch submission demonstrates the opportunities-board / pitch-CPT stack is production-grade from the artist side. M5 will focus on the supervisor-side response cadence to close the loop and produce the first licensed placement from this feed.
- 2. **Read-completion on legal docs (57 events) is disproportionate to the total user population (47 users).** Repeat readers are studying the SLFS-v1 terms and the sync-license framework — strong indication the licensing model is being understood, not merely bounced.

10 · Second addendum (2026-07-29 → 2026-08-07) — first fully organic artist onboarding

The single most important user-feedback event of the M4 period occurred **after** the addendum above was written, and it is the strongest evidence in this report that the marketplace works unassisted.

10.1 Hexain — self-service onboarding with zero intervention

On **2026-08-01** a previously unknown artist registered on sync.land and, without any contact, onboarding call, hand-holding, or manual data repair by the project team, completed the entire artist funnel:

STEP	TIMESTAMP (UTC -5)	OUTCOME
Account registered	2026-08-01 17:33	Self-service
Terms of Use accepted (v2026-07-10)	2026-08-01 22:34	Recorded with IP, source registration
Artist profile created	2026-08-01 17:39	Self-service
Duplicate profile created and deleted by the user	2026-08-01 17:39	See §10.2
Album 1 — <i>Oldest Hexain Songs</i> (4 tracks)	2026-08-04 00:56	Uploaded, processed
Album 2 — <i>“New” Song Pack</i> (6 tracks)	2026-08-04 01:17	Uploaded, processed
Album 3 — <i>Motivation Spike Songs</i> (8 tracks)	2026-08-04 02:42	Uploaded, processed

Result: 3 albums, 18 tracks, 1 h 30 m of music, published in a single evening by a first-time user.

Pipeline integrity was verified track-by-track after the fact: **all 18** have durations, waveform peak data (~2,650 samples each) generated within ~5 seconds of upload, resolvable audio URLs, and **clearance declared (`one_stop = 1`) on every track**. Zero failures, zero manual intervention, zero support requests.

10.2 A user-recoverable mistake — self-service delete, validated in the wild

While creating their profile the artist accidentally created a second one, titled “*I ACCIDENTLY MADE 2 JUST IGNORE THIS ONE*”, and then **deleted it themselves** using the self-service artist-profile deletion shipped during M4 (see *Marketplace Updates*, self-service delete for empty artist profiles).

This is the ideal outcome for a marketplace feature: a real user hit a real edge case, resolved it without contacting anyone, and left an audit trail. Prior to M4 this would have required a manual database intervention by the project team.

One residual defect was surfaced by this event and is logged for M5: the discarded profile briefly held the `hexain` slug, so the surviving profile permanently resolves at `/artist/hexain-2/`. The slug is now free and the canonical URL should be reclaimed.

10.3 Aggregate platform state at M4 submission

METRIC	VALUE
Registered users	48
Published artist profiles	19
Published albums	56
Published songs	398
Artist pitches submitted	30
Licenses issued	7

10.4 Engagement, 2026-07-15 → 2026-08-07 (full window since draft)

SIGNAL	COUNT
Time-on-page heartbeats	929
Page views	645
Licensing/legal docs read to completion	126
Survey banner impressions	48
Song plays / pauses	4 / 19
Outbound clicks (artist external links)	5
Add-to-cart events	2
OBS-player stream plays (via: obs_player)	1

10.5 LLM referral has become a repeating acquisition channel

M3 evidence recorded the *first* ChatGPT-referred visit (2026-07-06) as a novelty. It is no longer isolated — two further independent sessions arrived during this window, both carrying

`utm_source=chatgpt.com` :

- **2026-07-31** — landed on `/about/`, browsed to an artist page, clicked out to the artist's Spotify, then **added a track to cart**. Anonymous; blocked at authentication before checkout.
- **2026-08-02** — landed on the homepage, engaged the catalog visualization, then played a track from a genre page.

Both sessions show the full intended discovery path (landing → artist → work → commercial intent) originating from an AI assistant rather than a search engine. The recurring drop-off at anonymous-cart-to-authentication is the clearest conversion defect in the funnel and is carried into M5.

10.6 What this changes about the M4 conclusion

The earlier sections of this report characterise Sync.Land's user base as a small, hand-recruited pilot cohort whose feedback was gathered through direct contact. §10.1 is qualitatively different: an artist the team has never spoken to found the platform, accepted the terms, and published a substantial catalog correctly, unaided. That is the transition from *pilot* to *marketplace*, and it happened inside the M4 window.
