

ACCEPTANCE CRITERIA
MAPPED TO ARTEFACTS

Prepared by Awen LLC · <https://sync.land> · Project #1100272

This index maps each M5 acceptance criterion to the artefact that satisfies it.

M5 is the project retrospective, so it also points back to the artefacts already accepted under M1 to M4 rather than restating them, and forward to the three supporting documents produced in the closeout fortnight that the report draws on.

Criterion 1: The closeout report thoroughly documents the results and outcomes of the project

ARTEFACT	LOCATION
Closeout Report	SyncLand_Closeout_Report_M5.pdf

Covers goals versus outcomes across all five milestones, the full feature inventory, final system architecture, production metrics read on the date of issue (2026-09-29), lessons learned, and the roadmap beyond Fund 11.

The report is candid about five places where outcomes diverged from the proposal (section 2.1): the on-chain receipt is a timestamp rather than a rights assertion that any distribution platform accepts; the free tier changed licence from CC-BY to a purpose-written Free Sync License; a third licensing tier was advertised without a purchase path and cost the platform one artist's catalogue; the marketplace so far has one side, with fourteen licences issued and none bought by an outside buyer; and delivery ran 271 days past the proposal schedule. It also restates the terms-signature figure that the M4 pack expressed inconsistently (section 5.5) and names a defect in its own analytics (section 5.4).

SUPPORTING DOCUMENT	LOCATION	WHAT IT EVIDENCES
AI-music detection research note	supporting/ai-music-detection-2026-09.md	Report sections 3.6 and 6: the measured state of generated-audio detection on this catalogue (38-file pilot, no separation from spectral heuristics, no C2PA manifests found, the generator stamp in file metadata), and the design of the provenance v2 check that shipped from it
Acquisition and funnel audit	supporting/acquisition-audit-2026-09.md	Report sections 5.6, 5.8 and 7: referral sources by month, the ChatGPT channel, landing-page conversion, the registration-to-first-track funnel, the buyer-side gap, the cache-shared session identifier, and the ranked recommendations the roadmap draws on
Share-card samples	screenshots/share-card-song.jpg , share-card-song-no-cover.jpg , share-card-album.jpg , share-card-artist.jpg , share-card-brief.jpg (and the -portrait variants)	Report section 3.2: the branded share card rendered for every song, album, artist and brief, including the AI-declaration chip where a track carries one
Metrics re-read scripts and outputs	M5_Finalization_source/metrics.php , metrics-followup.php , metrics-supplement-2026-09-29.php , metrics-2026-09-29.txt , metrics-followup-2026-09-29.txt , metrics-supplement-2026-09-29.txt (kept with the sources, not in the public pack)	Every figure in report section 5, reproducible against production

Criterion 2: The closeout video thoroughly documents the results and outcomes of the project

ARTEFACT	LOCATION
Closeout video (public YouTube)	https://youtu.be/raXV5g6JdKs
Closeout video (repository copy)	<code>SyncLand_Closeout_Video_M5.mp4</code>
English captions	<code>SyncLand_Closeout_Video_M5.srt</code>

A public YouTube video, because Catalyst accepts the close-out video only as a public YouTube or Vimeo link, not as a file or a drive link. The same file sits in this folder as a copy of record. Runtime **4 min 52 s**; 1080p, English commentary, English captions. Ian McCullough presents it, on camera and over the live site, signed in as an ordinary artist account rather than an administrator. It takes the four parts the Catalyst close-out video asks for, in order.

PART	WHAT THE VIDEO SHOWS
Opening	The Awen x Sync.Land sting: Project Catalyst Fund 11 closeout.
1. Challenge and funding	Ian on camera, with a name title. Project 1100272, funded in Project Catalyst Fund 11 under Cardano Use Cases: Concept. The problem for independent musicians, who have no plain way to license a song for sync, and for buyers, who have no plain way to prove what they licensed; and the peer-to-peer marketplace built to answer both.
2. Progress and KPIs	The homepage and its genre constellation, with the catalogue figures read on screen: 653 tracks, 85 artists in 26 countries. Discovery through ChatGPT and other language models, and the machine-readable site summary at <code>/llms.txt</code> .
3. Demonstration	On the live site: the artist dashboard and its licensing controls; the briefs board and the pitch flow, with 194 pitches from 29 artists; a licence's public verifier, which needs no account, and its CIP-25 receipt on the Cardano preprod explorer; the <code>/licensing/</code> page with its three tiers (Free Sync, Commercial with a step deal, Custom and Exclusive) and its on-chain verification section; and streaming, from getting a player link on <code>/stream/</code> to pasting it into the Sync.Land player in OBS, opening the Electronic pick playlist, playing it, and the licence credit overlay appearing live on the stream.
4. Commercialisation	Sync.Land continues past the grant into commercial testing. The honest gap: it needs more buyer demand. What streaming taught: micro-sync, per-use licences paid for by apps over x402 or by AI agents through Masumi, settled on Hydra for throughput and lower fees. The business model and future funding: a 30% platform fee with 70% to the artist; a pre-seed round for the next phase; and that Sync.Land may return to Project Catalyst for the open-source pieces. Thanks to the Cardano community, Project Catalyst and the reviewers.
End card	<code>sync.land</code> , <code>github.com/Awen-online/sync.land</code> , Project Catalyst Fund 11 · project 1100272.

The figures on screen were read at recording, about 18:40 site time on 29 September 2026. Section 5.1 of the closeout report reconciles them with its own reading three hours later: the 653 tracks are the songs published at that moment (660 at the reading), and the 85 artists in 26 countries are the published artist profiles that name a country (93 profiles in all, 67 with music). The 194 pitches from 29 artists is the count read the evening before for every pitch since the board opened in July (section 5.3); by the reading it was 201 from 31 artists, 164 of them in September.

Supporting evidence from earlier milestones

The closeout rests on work already submitted. These are the artefacts a reviewer can open to verify the claims in the report.
