

Evidence Index

ACCEPTANCE CRITERIA MAPPED TO ARTEFACTS

Project Catalyst Fund 11
Milestone 4 - Marketplace Updates & API Launch
Reporting period: 2026-06-23 to 2026-09-01
Issued: September 2, 2026

Prepared by Awen LLC · <https://sync.land> · Project #1100272

This index maps each M4 acceptance criterion to the artefact that satisfies it.

Criterion 1: User feedback gathered, analyzed, documented

ARTEFACT	LOCATION
User Feedback Report	<code>SyncLand_User_Feedback_Report_M4.pdf</code>

Covers 6 structured survey responses (NPS avg 8.7), consent coverage on both capture paths, 37 pitches on open briefs from two artists, 8,161 behavioral events since M3, and direct communication samples.

The report also closes a request-to-usage loop inside one milestone: the briefs board and pitch system were the most-requested feature in the M4 window, shipped 15 days after the request, and are now the most heavily used thing built in the milestone.

Criterion 2: Marketplace updates and bugfixes clearly displayed

ARTEFACT	LOCATION
Marketplace Updates changelog	<code>SyncLand_Marketplace_Updates_M4.pdf</code>
Project Status Report	<code>SyncLand_Project_Status_Report_M4.pdf</code>
Project Timeline	<code>SyncLand_Project_Timeline_M4.pdf</code>

Shipped work between 2026-06-23 and 2026-09-01, organised into seven functional areas and five shipping cycles, with verifiable commit hashes.

Criterion 3: External application verifies a sync license via public API

The application: Sync.Land OBS Player, a DMCA-safe music player that runs as an OBS Custom Browser Dock.

ARTEFACT	LOCATION / LINK
Public licence verifier, no credentials needed	https://www.sync.land/wp-json/FML/v1/licenses/12277/verify
The same, for a Commercial licence	https://www.sync.land/wp-json/FML/v1/licenses/12278/verify
Negative case, unknown licence	https://www.sync.land/wp-json/FML/v1/licenses/999999/verify

Publicly launched, not merely available. The dock was announced publicly on 2026-08-31 in *The Sync.Land dock is live: music you are cleared to play*. The piece explains the problem it solves for streamers, states the guarantee in plain terms (“only music you are cleared to play”), documents the two-part setup, and shows the on-stream attribution badge. It was published alongside launch posts on X, Instagram and LinkedIn the same day. Output 3 of this milestone is “the API module is publicly launched”; this is the launch, and it follows the same announcement pattern as the M3 submission.

The feature was also **demonstrated publicly on 2026-08-17**, the same day the v0.2.0 release commit `b522ae9` landed, in posts from the founder’s own accounts. Those are listed above as the first public demonstration. They matter separately from the launch: they show the dock being shown to an audience on the day it shipped, rather than assembled for a submission afterwards.

Verifiable by a reviewer directly, with no credentials. The licence verifier is a public GET endpoint. Opening it in any browser returns the work, the licence type, whether a Cardano record exists, and the transaction that carries it, without a token, an account, or any contact with us:

```
https://www.sync.land/wp-json/FML/v1/licenses/12277/verify
```

An unknown licence returns a structured failure rather than an error page, which is what makes the endpoint safe to probe:

```
https://www.sync.land/wp-json/FML/v1/licenses/999999/verify
{"success":false,"error":"License not found"}
```

The recording also streams at <https://youtu.be/IJu1HfinQw> for a reviewer who would rather not download the file.

The API request being demonstrated:

```
GET https://sync.land/wp-json/FML/v1/streamer/track/{id}/clearance
Authorization: Bearer <personal access token>
```

Returns `can_stream`, `tier`, `tier_label`, `attribution_required`, `attribution_text`, `stream_url` and song metadata. The dock displays the endpoint, HTTP status, latency and verdict on screen, and exports a copyable receipt containing the full request and response.

An unauthenticated request returns `401`, demonstrating the auth boundary:

```
curl -i https://sync.land/wp-json/FML/v1/streamer/me
```

What the recording shows

The test case is a single unedited-in-substance take, 6 minutes 50 seconds, recorded 2026-09-02. In order:

FROM	CONTENT
0:00	Identification: name, project 1100272, Milestone 4, acceptance criterion 3
0:35	OBS Studio, the dock added as a Custom Browser Dock
1:30	sync.land, sign in, the Milestone 4 playlist and its five tracks
2:30	A personal access token generated live at /account/tokens/
3:10	The token pasted into the dock inside OBS; the playlist loads
3:40	Tracks played, licence state shown per track
4:20	The back end play log, refreshed, showing the three requests just made, their raw JSON, and the licences behind them
5:00	The on-stream attribution overlay, and the same licence verified in a fresh incognito window with no token, no account and no session, followed by an unknown-ID request returning "License not found"
6:35	Close

The server's own record of the recorded session

A screen recording shows what an operator saw. It cannot, by itself, show that the API was called: a reviewer is taking the narrator's word for it. Sync.Land records every play through the streamer API to a usage ledger, independently of the client, and that ledger corroborates the recording.

The session captured in the test case video produced these rows, exported at `M4_play_log_2026-09-02.csv`. Times are UTC and match the recording's own timestamps.

#	TIME (UTC)	TRACK	ARTIST	ENDPOINT	TOKEN	LATENCY	OUTCOME
1	19:52:53	Island Vibe	Creepzz	POST /streamer/track/11907/played	9	266 ms	skipped
2	19:53:14	The Power of Flight	Cullah	POST /streamer/track/11886/played	9	239 ms	skipped
3	19:53:18	Hexain - Victory Lap	Hexain	POST /streamer/track/12066/played	9	219 ms	stopped

The personal access token used, id 9, was created at **19:52:21 UTC**, thirty-two seconds before the first play, during the recording. Three different artists are represented, two of them third parties rather than the applicant.

Each row also stores the clearance verdict as it stood at the moment of play: the tier granted, whether attribution was required, the rights state of the owning artist, and the terms version in force. That is the audit trail behind the claim that a licence is checked before a track plays. It is not derived later from current data, which would prove nothing, but written at play time.

The exported columns include, per play: the HTTP method and endpoint, the token id that authorised it, server-side latency, the clearance tier, the attribution obligation, the rights state, how much of the track was heard, why it ended, and the licences issued for that work with their Cardano transaction hashes. The credential itself is never recorded.

A limitation, stated plainly. The `heard` column reads zero for this session. When the on-stream overlay owns audio output, which is the configuration the video demonstrates, elapsed position is held by the overlay and the dock reports zero. The outcome column (skipped, stopped) is recorded correctly. Duration-heard is reliable only for local playback in the dock.

Criterion 4: Documentation is clearly written

Marketplace platform code lives in a private repository; the reference external application is public and Apache 2.0 licensed, since it is the artefact a reviewer needs to inspect and run.

Platform state at submission (2026-09-01)

METRIC	VALUE
Registered users	56
Published artists	24
Artist territories represented	8
Published songs	413
Published albums	60
Pitches on open briefs	37
Users with timestamped acceptance of current Terms	15
Consent-gate signatures (subset, versioned log)	9 across 5 users
Behavioral events since M3	8,161
