POST-LAUNCH FEEDBACK CHANNELS & RESPONSES

Milestone 4 - Marketplace Updates & API Launch

Reporting period: 2026-06-23 to 2026-08-31

Issued: August 31, 2026

Prepared by Awen LLC · <https://sync.land> · Project #1100272

Executive summary

Between the Milestone 3 marketplace launch on 2026-06-23 and this submission on 2026-09-01, Sync.Land gathered user feedback through four instrumented channels: an on-site survey, activity on the brief and pitch system, behavioural analytics, and direct correspondence with artists.

This report sets out what that feedback said, what we did about it, and what it tells us to do next. Figures were read from production on 2026-09-01.

METRIC	VALUE
Survey responses	6
Net Promoter Score, mean	8.7 / 10
Pitches submitted against open briefs	37
Behavioural events since M3	8,161
Registered accounts	56
Published artists	24, across 8 territories
Published songs	413

The finding that matters most is a closed loop. The single largest feature request in the survey data arrived on 2026-06-22. It shipped on 2026-07-07, was first used on 2026-07-10, and has since carried 37 pitches. The most recent of those came from an artist who found Sync.Land through a search engine

and reached the pitch stage without ever being contacted by anyone here. A request that becomes a shipped feature and then becomes the most used thing in the milestone, inside one reporting window, is the strongest evidence available that the feedback channels are working as intended.

1 • How feedback is gathered

Four channels, all instrumented, all still running.

On-site survey. A short survey offered through a homepage banner and inline prompts, capturing a Net Promoter Score, the respondent's role, how they found the platform, ease ratings for licensing and uploading, and a free-text feature request. Responses are stored with a session identifier rather than requiring an account, so a visitor can answer without signing up.

Brief and pitch activity. Sync.Land publishes open sync briefs from music supervisors. Artists browse them and submit pitches of up to three of their own tracks. Every pitch is a record with a status, so adoption of the feature is directly measurable rather than inferred.

Behavioural analytics. Page views, dwell time, long-form read completions, playback, cart and checkout events, and upload pipeline events, each carrying a timestamp and a session identifier.

Direct correspondence. Email threads with artists during onboarding and support. These are the only qualitative channel where a person is writing to us in their own words at length, and they are where several findings in this report originated.

Terms acceptance is also captured, with a version and a timestamp, as an audit record rather than as feedback. In summary: 15 of 56 accounts hold a timestamped acceptance of the current Terms version, and the remainder are legacy registrations carrying a backfill marker with no timestamp. The per-account audit detail lives in the admin console and is deliberately not reproduced in this document.

2 • What users said

2.1 Survey responses

Six responses across the platform's life, four of them predating this reporting window and two received within it. Respondents are identified by session only.

#	DATE	ROLE	NPS	FOUND US VIA	UPLOAD EASE
1	2026-03-15	Licensee	10	Social media	n/a
2	2026-06-18	Licensee	7	Word of mouth	5
3	2026-06-20	Licensee	10	Word of mouth	5
4	2026-06-22	Licensee	5	Social media	n/a
5	2026-07-29	Artist	10	Search engine	4
6	2026-08-25	Artist	10	Search engine	5

Mean NPS is **8.7**, and rising: both responses received in this window scored 10.

The change in acquisition channel is the more interesting signal. Every respondent before this window came through social media or word of mouth, which is to say through the hand-recruited pilot cohort. Both new respondents are artists who arrived through a search engine, unprompted, and rated the upload experience 4 and 5 out of 5. That is a different class of evidence from a pilot user being asked for their opinion.

2.2 What they asked for, in their own words

Response 4, 2026-06-22. The anchor request of this milestone:

"Can we get a process to negotiate the cost of our license? and can we see the active prompts for any sync placements that people are looking for? Like a classifieds or real marketplace buy/sell communication? I'd like to DM the filmmakers."

Response 6, 2026-08-25.

"I am not sure yet, but please don't make people spend their money beforehand. Let them earn it here first."

This one asks for something Sync.Land already does, which is why it is worth recording. There is no listing fee, no subscription and no upfront cost to an artist: the platform fee comes out of a licence sale, and nothing is charged until one happens. A prospective artist could not determine that from the home page, the about page or the licensing page, all of which referred to "a platform fee" without stating that listing is free. **This is a communication failure, not a product gap**, and it is the clearest instance in the dataset of the site losing ground to a misconception it could dispel in one sentence.

Response 3, 2026-06-20. "Comment capabilities on songs, like SoundCloud." Not shipped, carried to M5.

Response 1, 2026-03-15. "Agentic AI." Evaluated as a future augmentation of pitch matching, deferred.

3 · What we changed because of it

3.1 The request that became the most used feature in the milestone

Response 4 asked for four things. Each shipped inside the M4 window.

ASKED FOR	SHIPPED AS
"see the active prompts for any sync placements"	The open briefs board at <code>/briefs/</code>
"real marketplace buy/sell communication"	Pitch records plus an admin review queue
"I'd like to DM the filmmakers"	Pitches forwarded to the music supervisor, rather than direct messaging
"negotiate the cost of our license"	Artist-set pricing, plus a free tier that removes the need to negotiate at creator scale

Direct messaging was deliberately not built. Putting artists and supervisors into unmediated contact creates a compliance surface we are not equipped to police, and the outcome the request actually wanted, which is getting a track in front of the person choosing music, is served by forwarding.

Elapsed time from request to shipped: 15 days.

3.2 It is being used, and not only by the people we recruited

STAGE	EVIDENCE
Requested	2026-06-22, survey response 4
Shipped	2026-07-07
First pitch received	2026-07-10, three days after launch
Total pitches to date	37, from two artists
Reached without any contact from us	2026-08-17

Of the 37 pitches, 32 came from an artist recruited by hand during the M2 pilot, who returned in this window after a re-engagement email and has pitched steadily for six weeks. That demonstrates the feature works.

The remaining 5 demonstrate something harder to arrange. They came from an artist who found the platform through a search engine, registered, accepted the terms, created a profile, uploaded three albums, and then began pitching against live briefs, with no contact from anyone here at any stage. A recruited artist using a feature proves the feature. An artist who arrives alone and reaches the same point proves the funnel.

3.3 Other work driven by feedback and observation

- **A free tier that does not require negotiation.** Shipped 2026-07-11.
 - **Self-service artist profile deletion.** Added after users created duplicate profiles; subsequently used successfully in the wild by an artist to recover from their own mistake, with no support request.
 - **Artist-controlled pause and removal of songs,** so an artist can withdraw work without contacting us.
 - **Cover art inheritance from album to song.** Tracks uploaded through the album flow were returning no artwork through the API. Coverage went from 365 of 402 to 390 of 402 at the time, and is **401 of 413** today.
 - **An AI-use declaration at upload.** Artists are asked directly whether AI was involved, and the answer travels with the track's clearance record.
-

4 · How the platform is being used

8,161 events between 2026-06-23 and 2026-09-01.

EVENT	COUNT	READING
Time on page	4,249	Dwell heartbeat while a tab is active
Page views	2,749	Distinct page loads
Long-form read completions	397	Licensing and legal pages read to the end
Survey banner impressions	279	See §6.1
Song pauses	82	
Song plays	34	
Catalogue visualiser refreshes	34	
Stream plays via the OBS player	30	Playback through the external application
Add to cart	15	
Songs uploaded	9	
Albums uploaded	7	
Transcodes completed	6	
Licence modal opened	4	
Checkout started	4	

Three readings are worth drawing out.

397 long-form read completions against 56 accounts. These fire on the licensing and legal pages, which are the least entertaining documents on the site. A completion count seven times the size of the user base means people are studying the licence terms rather than skimming past them, and several are returning to do it again. For a licensing marketplace this is the engagement metric that matters most.

Stream plays rose from 3 to 30. The OBS player has moved from author testing into use.

Checkout starts appear for the first time. They did not exist at the M4 draft. The count is small, and §6.2 explains where those sessions stop.

5 • How people are finding us

Search engines are now an acquisition channel. Both survey respondents in this window arrived that way, as did the artist described in §3.2. None of them was recruited, contacted or prompted.

AI assistants are a repeating referrer. The first visit referred by ChatGPT was recorded on 2026-07-06 and treated as a novelty. Two further independent sessions arrived in this window carrying the same referrer. One landed on the about page, browsed to an artist, clicked out to that artist's Spotify, and added a track to the cart. The other landed on the home page, engaged the catalogue visualiser, and played a track from a genre page. Both followed the full intended discovery path, from landing through artist to work to commercial intent, having started from an AI assistant rather than a search engine.

Unassisted onboarding now completes end to end. In this window an artist registered, accepted the terms, created a profile, recovered from a duplicate profile using self-service deletion, published three albums totalling 18 tracks in a single evening, and later pitched against live briefs. The pipeline was verified track by track afterwards: every track had a duration, waveform data generated within seconds of upload, a resolvable audio URL, and a clearance declaration. Zero failures, zero manual intervention, zero support requests.

That is the transition from a pilot with users we know personally to a marketplace that works for people we have never met, and it happened inside this milestone.

6 · What we got wrong

6.1 The survey banner does not convert

The banner was shown 279 times in this window and produced 2 completions. Whichever way the denominator is cut, conversion is below 1%. The small response set in §2.1 reflects that friction and not a lack of activity, since the same window carries 8,161 behavioural events. Carried to M5, most likely as a dwell trigger or a post-signup prompt rather than a banner.

6.2 Anonymous visitors are lost at the cart

The clearest conversion defect in the funnel. Anonymous sessions reach the licence modal and add a track to the cart, then hit an authentication wall before checkout and do not return. Both AI-referred sessions described in §5 ended this way. The requirement itself is sound, since a licence must be issued to an identifiable party, but its placement asks for the account at the moment of highest friction and lowest commitment. Carried to M5.

6.3 One artist left

One artist removed their catalogue during this window for reasons unrelated to the platform. The departure is recorded here because of what it demonstrated rather than what it cost: the artist-controlled removal tooling worked exactly as designed, without intervention from us, which is the behaviour we want even when the outcome is not.

6.4 Consent coverage is incomplete

15 of 56 accounts hold a timestamped acceptance of the current Terms. The remainder are dormant legacy registrations carrying a backfill marker. Every artist who has registered since the consent gate went live is current, but the gap will not close through a passive session gate because those accounts do not return. An outbound pass is carried to M5.

7 • Platform state at submission

Read from production on 2026-09-01.

METRIC	VALUE
Registered accounts	56
Accounts registered since M3	11
Published artists	24
Artist territories represented	8
Published albums	60
Published songs	413
Songs carrying cover art	401 of 413
Pitches on open briefs	37
Licences issued	8
Survey responses	6, mean NPS 8.7
Behavioural events since M3	8,161

8 • What this means for Milestone 5

1. **Close the anonymous cart gap.** It is the only place in the funnel where demonstrated commercial intent is being lost, and it has now been observed more than once from acquisition channels we did not pay for.
2. **Say what it costs to be an artist here.** Survey response 6 is evidence that the free tier is not legible from the outside. This is a copy change, not a product change, and it has since been made on the about page.

3. **Fix feedback collection itself.** Sub-1% banner conversion means the qualitative channel is the weakest instrument we have, on a platform where the qualitative signal has been the most valuable.
 4. **Close the supervisor side of the pitch loop.** 37 pitches have been submitted and the artist side is proven. M5 should produce the first licensed placement originating from a brief.
 5. **Complete consent coverage** for dormant legacy accounts through an outbound pass.
-
